'rhb2@cdc.gov'; 'jfc1@cdc.gov' FW: "vaccine preservative WG"

Roger/Jose: have not yet received Roger's "position paper" by e-mail, but wanted to get some comments to you quickly. Draft we heard on the call is really excellent. However, (1) would add some of the elements of my "pros and cons" listing below (especially related to the BENEFITS of having thimerosal in the first place); and (2) try to avoid suggesting that the "interim plan" would be effective "immediately". The fact of the matter is that an "interim plan" (for potential removal of thimerosal) has ALREADY been in place for MANY YEARS ... we just need to "speed up" the EXISTING plan ... not create a "new" interim plan". We are proactive ... not reactive. Thianks. Peter P.

"Myers, Martin G.", 'sis2@cdc.gov'; 'ezg0@cdc.gov'
RE: "veccine preservative WG"

PLEASE GIVE TO MARTY MYERS ASAP.

Marty: I have developed a "quick-and-dirty" pros and cons analysis for the AAP policy statement:

The AAP should release its policy statement in more-or-less current form:

## **PROS**

Will demonstrate that the AAP reacted urgently to recently uncovered information, and to disclose this information to practitioners and consumers.

Will demonstrate that the AAP adopts the most conservative position possible when it comes to protecting American

Will force manufacturers to develop "crash" programs for removal of all thimerosal from all vaccines.

## CONS

Will raise questions about FDA being "autoop at the awtich" for decades, by allowing a potentially hazardous compound to remain in many childhood vaccines, and not forcing manufacturers to exclude it from new products. Will also raise questions about vertices achievely bodies about appressive recommendations for use. [We must keep in mind that the desired by increasy was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury' was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury' was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury' was advised by 'rocket science', conversion of the % thimsround to actual up of mercury' was advised by 'rocket science', conversion of the % thimsround to actual up of mercury' was actually produced by 'rocket science', conversion of the % thimsround to actual up of mercury' was actually the must keep in mind that the desired by 'rocket science', conversion of the % thimsround to actual up of mercury' was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury' was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury' was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury' was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury' was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury' was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury' was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury' was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury was not generated by 'rocket science', conversion of the % thimsround to actual up of mercury was not generated by 'rocket science', conversion of the calculations' was not generated by 'rocket science', conversion of the calculation of the calculation of the calculation o

Will precipitate a vaccine shortage, leaving many children unimmunized. Removal of thimerosal could delay the availability of sufficient supplies of vaccines for at least 2 years, pending proper studies.

Thirmerosal has benefits: It is there for a reason. Precipitous removal may generate problems in vaccine stability (affecting efficacy), and component inactivation (affecting safety). Proper studies must be done before it can be removed from products without a thirmerosal-free presentation.

Will precipitate a worldwide crisis in confidence in vaccines. This is especially true for whole-cell DTP vaccines, which are still being used throughout much of the world. Thirnerosal is used in these vaccines as an inactivating agent for pertue

ALTERNATE APPROACH: LOW KEY, SYSTEMATIC, DELIBERATE PRIVATE-PUBLIC APPROACH

## **PROS**

Already going on for quite some time.

Shows careful consideration to all benefits and risks (as enumerated above) with rational and deliberate plan of action.

Consistent with European position.

SMC
